PRECIOUS METALS IN FEBRUARY 2001

U.S. mines produced 25,000 kilograms (kg) of gold and 129,000 kg of silver in February 2001. Compared with January 2001, production of gold was down 6% and 19% in California and Nevada, respectively, and silver production was up 6% in Nevada.

Gold

Domestic.—Golden Phoenix Minerals, Inc. poured its first doré bar at its recently acquired Mineral Ridge gold mine in Esmeralda County, Nevada. Production came from rinsing of gold ore on the mine's leach pads as required for cleanup of the processing plant under a current operating permit from the Nevada Department of Environmental Protection. Normal circulation of the rinsing solutions produced about 5 kg (150 troy ounces) of gold per month (The Mining Record, 2001). Newmont Mining Corp. signed a letter of intent with El Paso Merchant Energy Co., a subsidiary of El Paso Corp., to negotiate a 15-year power purchase agreement for 150 megawatts (MW) of a proposed 480-MW power plant near Carlin, Nevada. Newmont uses 175 MW of power per year, getting 110 MW from Sierra Pacific Resources (American Metal Market, 2001).

International.—Glamis Gold Ltd. reported that it started commercial production at its new San Martin gold mine in Honduras. The mine produced about 340 kg (10,900 ounces) of gold in January 2001 and is expected to produce over 3,500 kg (113,000 ounces) of gold in 2001 (Platts Metals Week, 2001b). World gold demand set a new quarterly record during the fourth quarter of 2000. The demand for gold was 894,300 kg, up 11% from the fourth quarter of 1999 and 2% higher than the previous record set in the third quarter of 1999. Demand for gold jewelry was 792,700 kg, 12% higher than in the fourth quarter of 1999. Investment demand for gold was 101,700 kg, 4% higher than in the fourth quarter of 1999. However, investment demand for

2000 as a whole was 21% below the exceptional demand recorded in 1999 when fears of Y2K disruption boosted investments in gold (World Gold Council, 2001).

The London Bullion Market Association's gold clearing statistics registered significant declines in January. Gold transfers were down about 17% in comparison with those of the preceding month, decreasing to a daily average of 19.7 million ounces (613,000 kg). The daily average number of gold transfers dropped from 833 to 730. In addition, the quantity of gold transferred in January 2001 was about 11% less than that of January 2000 (Platts Metals Week, 2001c).

Silver

Idaho-based Coeur d'Alene Mines sold its 50% stake in Gasgoyne Gold Mines of Australia for \$15.6 million to Sons of Gwalia. Also included in the sale was Coeur's share of Gasgoyne's gold hedge position of about 2,800 kg as well as its exploration properties across Australia. According to Coeur, the sale will allow the company to focus on its core business of silver mining and exploration, starting with a 1,220-meter drilling program underway at the Rochester Mine in Nevada. Coeur is also completing development of the Silver Valley operations in northern Idaho and feasibility studies at the San Bartolome project in Bolivia (Northern Miner, 2001).

Platinum-Group Metals

News of impending Russian exports of palladium and the daily offerings of the metal by the U.S. Defense Logistics Agency's National Defense Stockpile caused prices to plunge during the week of February 19. Palladium prices, which had been rising rapidly in recent months, fell \$129 for the week to \$851 per troy ounce (ounce) at the London PM Fix on February 23. The NYMEX (New York Mercantile Exchange) nearby March palladium futures contract fell \$119 to \$855 per ounce

during the same period. Palladium futures on the TOCOM (Tokyo Commodities Exchange) fell by their daily permissible limits on February 23 for the second consecutive day. The TOCOM spot palladium contract fell ¥214 (\$1.85) to ¥3,435 (\$29.66) per gram (g) and the more active December contract fell ¥120 to ¥3,305 per g. According to trade sources, the selling was mainly by speculators who had accumulated substantial long positions with expectations of prolonged delays in Russian exports (Platts Metals Week, 2001d).

Anglo American Platinum Corp. reported that it plans to build a new \$160 million smelter in South Africa by early 2003 as it prepares to increase PGM production to 108,900 kilograms (kg) per year by 2006. The smelter will be built in the Pietersburg area and Anglo expects to complete the project within 22 months, subject to expedient completion of an environmental impact assessment and successful conclusion of utility supply contracts. Anglo Platinum reported earlier in 2001 that its Maandagshoek Mine, expected to produce 5,040 kg per year of PGM and costing \$160 million, will start operating in 2004 (Platts Metals Week, 2001a).

The removal of lead (Pb) from electronic components has become a new consideration for the adaptation of palladium leadframe (metal frame around which integrated circuits are fabricated) finishes. In particular, the palladium leadframe plating process has been found to reduce workplace health and safety concerns and decrease waste disposal. Palladium-plated leadframe technology began in the 1980s, primarily to reduce manufacturing steps in integrated circuit (IC) assembly; a single plating process can be used to insure good die attachment and wire bonding, reduce lead corrosion, and enhance solderability

to a printed circuit board. The initial applications were for low pin-count, surface mounted ICs as well as some selected through-hole components. There are many different ways in which palladium may be used as a leadframe plating material. Nickel-palladium plating, such as palladium over nickel over copper, is the most fundamental structure. Usually, a top layer of palladium with a thickness ranging from 0.025 to 0.127 micrometers protects the underlying nickel from corrosion. During the solder reflow process, the palladium dissolves into the solder, and solder joints are intermetallically bound with underlying nickel plate (Advanced Packaging, 2001).
